Abstract
Lupus nephritis is a frequent and serious complication in virtually most children with SLE, ranging from minimal involvement to progressive renal failure. Because of undetected incidence of lupus nephritis and its epidemiology among Egyptian children, this study included 100 patients with lupus nephritis following in the rheumatology clinic at Cairo University Children Hospital and aimed to describe their different clinical, laboratory, and pathological presentation, to investigate the clinicopathological correlation and medication received and follow-up achieved as well.

Keywords
Epidemiology, lupus nephritis, renal biopsy Egyptian children, Presentation, serum creatinine,
