Abstract

Delayed recovery from general anesthesia is a serious problem. There is many causes, either preoperative as premedication or intraoperative as residual drugs neuro muscular blocks, cardiac factors, ventilatory factors, metabolic encephalopathy, neurologic injury. This diagnosis of delayed recovery is very serious by using laboratory method or CT MRI. Treatment of the cause is essential by using antidote as neccan, neostigmine, flumazenil by adjusting after metabolic disturbance as diabetic, electrolyte disturbance as well as treatment of neurologic injury.
